

Seiki NMS

Seiki Systems has over 20 years experience in the development and provision of real time manufacturing execution and production control systems that provide an immediate, visual and dynamic picture of the 'plan to make' production process - your strategic and operational manufacturing management solution. We specialise in software that is designed to maximise the efficiency of production equipment and plant resources by addressing the complete works order lifecycle, from top floor to shop floor. The Seiki solution comprises of a suite of modular software including real-time scheduling, DNC and paperless manufacturing, SFDC and machine performance monitoring, W.I.P tracking, performance analysis and reporting and industrial touch screen PCs.

Manufacturing & Business Intelligence

Managing the critical link between production efficiency and profitability is essential to remaining competitive. The pressure to keep costs low whilst maintaining the high standards demanded by industry and customers is growing, emphasising the need to deliver value to the customer by eliminating waste through the entire manufacturing process.

Seiki NMS comprises of both manufacturing and business intelligence software, which at the shop floor level includes the display of work queues and job data collection, machine monitoring, technical data distribution, DNC and probe data collection. The top office analytical suite offers a remote display of machine status, machine performance analysis and individual job reports, key business tools that are necessary for effective work management and to achieve maximum utilisation of critical production resources.

Fast & Efficient Shop Floor Communications

Taking a lean approach to manufacturing means eliminating waste and reducing non-value adding activities for which fast, effective and simple shop floor communications are key. An integral component of Seiki NMS is our easily maintained shop floor communications and data management control system. NC programs can be filed on either the host PC or company server if networked, thus providing a more efficient method of working using fast and reliable file management that will ultimately help reduce errors. Manufacturing data is delivered directly to the shop floor where machine operators have access to the files stored on a remote server. Complete job information packs containing all the manufacturing data pertaining to an operation or component are available, with the additional flexibility of being able to view, edit and manipulate different file types, based on user access privileges. A graphical file status indicator provides confidence that all file transfers are controlled - the software is able to automatically restrict access to NC programs according to their status. This type of systematic control of manufacturing data can underpin your internal quality control procedures.

Seiki NMS benefits include:

- Creates a centralised factory knowledgebase
- Supports a lean systematic approach to the manufacturing process
- Eliminates inaccurate & time consuming manual methods
- Ensures only the latest manufacturing data is used
- Provides a dynamic, real time view of resource activities
- Supports continuous improvement strategies with real and accurate data
- Helps increase productivity and efficiency

Seiki NMS is a modular solution

Manufacturing Control

Becoming a more process focused organisation means manufacturing parts efficiently and cost effectively. IT solutions configured to collect data, disseminate information, increase visibility and automate everyday activities provide essential support in your efforts to operate a lean organisation, whilst creating a trusted factory knowledgebase where performance and quality can be achieved through control and continuity. Seiki NMS supports the effective distribution and flow of information throughout the manufacturing organisation, giving access to actionable performance data from the factory floor.

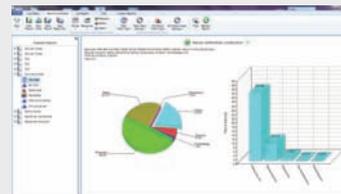

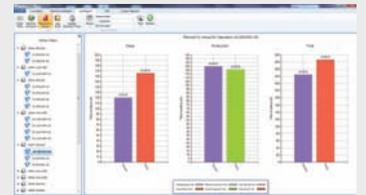

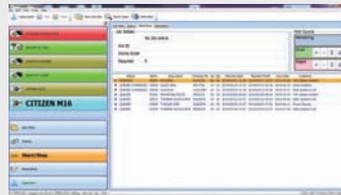

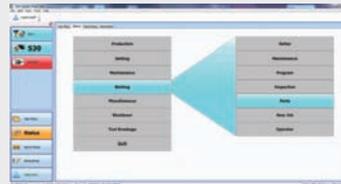

Manufacturing Intelligence

Seiki analysis software acts upon the central data repository, providing an easy method of accessing, viewing and summarising the manufacturing performance data, generating reports comprising of relevant management information based on real time data collection, which can then be used to inform strategies to optimise machine uptime, throughput and ROI. Identifying the reasons for lost productivity can help to reduce costs and improve manufacturing efficiency.

Real Time Visibility

Whilst traditional paper based methods can be used to collect and collate data they are often based upon historical data records and are likely to be inaccurate. Machine monitoring provides users with the ability to manually or automatically record the status of your manufacturing resources and reports on machine performance, both in real time and historically. Each operation status change can be derived automatically via digital signals received from the machine tool, providing continuous recording of production times, including the time and reasons for lost productivity, whilst operating conditions and status changes can also be manually entered on the shop floor. Used in conjunction with Seiki Factory View, which provides a dynamic, live view of the shop environment that is accessible from anywhere on the LAN/WAN, users have complete visibility of the production process, facilitating the control and flexibility required to focus on being responsive to customer demands.

Closing the Data Loop

Seiki Work Queue Manager software is an advanced API that enables scheduled works orders to be displayed directly on the shop floor for each workplace resource, providing forward visibility of the planned workload. The work queues can also be compiled into a single list for distribution around the site in order to co-ordinate supportive activities to the same set of priorities and deadlines. Work queues are an integral feature of Seiki SFDC, supporting work in progress tracking. Data entry is supported both manually and via barcode to collect data about each operation, including Job Start/Pause/Finish, Good/Scrap part counts, as well as calculating the duration of each operation, thus providing an understanding of actual performance and downtime reasons that will enable you to address critical areas and reduce levels of waste. The system can also be configured to provide direct updates to your scheduling system, creating a closed data loop.

Seiki NMS features include:

- Fast and efficient shop floor communications
- Full audit trail of file transfers
- Simple and accurate automatic and/or manual data collection
- Factory wide distribution of work queues
- Work in progress tracking
- Remote live views of individual machine status and activity
- Live status and alert warnings 24/7
- Graphic display of machine utilisation and lost productivity trends

The modularity of Seiki software provides you with a flexible solution and progressive upgrade path. Our aim is to work with you to secure your return on investment and support your business as it grows. We offer a complete service including planning, installation, implementation, customisation, training and after sales support.
